Notes

- Our subject code is SH 651.
- If a question was asked in Regular Exam, it is kept in **boldened** form. If it was asked in back exam, it is in regular font.
- Months are marked as:
 - Ba: Baisakh
 - Jth: Jestha
 - Asa: Ashar
 - Shr: Shrawan
 - Bh: Bhadra
 - Ash: Ashwin
 - Ka: Kartik
 - Mng: Mangsir
 - Po: Poush
 - Ma: Magh
 - Ch: Chaitra

(5 Marks)

1. Your leader is my son she said and not one of the soldiers doubt it. They fell in beside her, singing his praises, saying how clever and brave he is, and she listen to them with head proudly raise, showing no surprise. (82 Ba)
2. May I give him a bone he asked and when she nodded he asked courteously How long have you been in Yalta. For five days she replied. Time goes fast and yet it is so dull here she said not looking at him. (81 Ch)
3. The privileges of beauty are immense said Coctaeu. To be sure, beauty is a form of power. And deservedly so what is lamentable is that it is the only form of power that most women are encouraged to seek. This power is always conceived in relation to men it is not the power to do but the power to attract. (81 Bh)
4. the weather is better this evening he said. where shall we go now. Shall we drive somewhere he added. I have no idea, she replies. (81 Ba)
5. Then to may amazement, she gave me her phone number. That night, mary revealed that dropping my letter jacket in front of her was a stupid thing to do. She didn't care about what sports guys lettered in, she only cherished wonderful people with substance. fter I begin being myselfs, they quickly fell for one another so became "high school loves". (80 Ch, 71 Ma)
6. Look at that thought he the land is all being sold and I shall get none of it so he spoke to his wife. (80 Bh)
7. How could i despise you asked Gurov. You don't know what you are saying he adds. God forgive me said with her eyes fills with tears. (79 Ch, 80 Ba)
8. I count it as nothing, he told his sympathizers his eyes on the rope he was tying. What is egg-rasher Did i depend on it last week Or is it greater than other things that went with the war I say, let egg-rasher perish in the flames! (79 Bh)
9. Those children who listened to lot of baby talk were talking more than the babies that listens to mroe adult talk or standard speech, says Nairan Ramirez of the University of Connecticut. We also finds that it really matters whether you use baby talk in one-one-one context, she adds. (78 Ch)
10. I have no idea whether the right pronoun for God is He, She or It. But this I'm sure of. If god could somehow be induced to take that test, God will not come macho and not feminism, either, but right at the middle. Fellow androgynes, its a nice thought. (78 Ka)
11. Dr Brigitte halford, a professor of linguistics at Freiburg University in German agree bilinguals tends to use language better as a whole she says, 'They also display greater creativity and problem-solving ability, and they learn further languages more easily.' So with all of the benefit, why do we not show more enthusiasm for learning other languages. (78 Bh)
12. don't cry my darling. He said. You have had your cry that's enough...Let us talk now let us thought of some plan. (77 Ch)
13. How you frightened me said breathing hard still pale and overwhelmed. Oh how you frightened me. I am halfdead. Why have you come why. (76 Ch)

14. Who is knocking? whispered his wife lying beside him on the floor. I do not know he whispered back breathlessly the second knocking was so loud that the rickety old door could have fallen down. (76 Ash)
15. I reassure you of one thing. At any point in a period of spritual endeavour you can experience space and stillness. Every time you realise a truth, every time you sense the hand of god in your life or the incidentally support a fellow traveler, you become mentally still. Every time you are blessed with an insight, see someones in a different light. (76 Bh)
16. If the intention is to put in place a parallel agency it is not welcome he said, adding that it was important to known the jurisdiction of the propose taskforce. In a recent case of gold smuggling which is under investigation, the police has identify on the run MK agrawal as the main investor and racketeer. The taskforce will lok into such cases, the source said. (76 Ba)
17. But when the war is over, the country recedes from the consciousness and it is rarely even at the back of the mind. The question am I doing any good to the country doesn't occur to the mind; and even the question is what i am doing good or bad for the country occurs only rarely. A limited patriotism is better than none but is not enough. (75 Ash, 74 Ash)
18. A board game is a game played with counters or pieces that are placed or removed from or moved across a board simple board games often make ideal family entertainment. Since they are often appropriate for all ages. Some board games such like chess and Chinese checkers have strategic value and have been classic for centuries. (75 Ash 2, 72 Ma)
19. If you do not acknowledge weakness on the face of troubles and if you refuse to worry about your problems, you will find on how much more successful, peaceful, and happy your are. Daily make this affirmation. I will be neither lazy nor feverishly active in every challenge of life I shall do my best without worry about the future. (75 Ba)
20. Your leader is my son she said and not one of the soldiers doubt it. They fell in beside her, singing his praises, saying how clever and brave he is, and she listen to them with proudy raise, showing no surprise. (74 Ch)
21. What she goes on to describe is if you think about it a perverse variation of Theseus paradise. What if you started replacing the solid planks of his ship with rotted ones is it still the same ship after one plank is replaced how about half of them is there a point when Gerda is no longer gerda? (74 Bh)
22. An old cripled by rheumatism was about to step on to bus when a young man who was standing beside her asked may I help you. (73 Ma)
23. How perfectly sweet said Christine when Sarah confessed that Adit's decision had been made in the war with Pakistan. Now if my Simon was to find himself in such a spot he dfunk he would my Simon. When there was such a flap in Cuba and Russa and darling Kennedy was ever so brave Simon wanted to flee to greenland. (73 Bh)
24. Arundhati Roy the famous novelist and activist who won the booker prize in 1997 for her novel. The God of small things was born in shellong Meghalaya on november 24, 1961 to a Keralite mother and a Bengali father. (73 Shr)
25. But the Bengali lady with green who kept darting looks at the drummer rather than on the beautiful sitar player whispered suddenly he keeps staring at me Minakshi. Or, perhaps it is I who keep staring at him. I cant take my eyes off him Minakshi. (72 Ch)

26. A husband and wife were having problems and decided to end their union after a very short time together. After a brief attempt to reconcile, the couple went to court to finalize their break up. The judge asked the husband, what had brought you to this point, where you're unable to keep this marriage together. The husband replied, "In the six weeks we have been together, we have not been able to agree on a single thing" seen weeks the wife said. (72 Ash)
27. Two pastors are standing by the side of a road holding up a sign that reads. The end is near turn around now before it is too late! A passing driver yells, "you guys are nuts!" and speed past them. From around the curve, they hear screeching tyres- then a big splash. One of the pastors says to the other, do you think we should just put up a sign that says Bridge broken instead? (71 Ch)
28. My father learnt this lesson after leaving me a dozen voice mail messages none of which I listened to. Exasperated he called my sister to complain that I never returned his phone calls why are you leaving him voice mails my sister asked just text him. (71 Bh)
29. A woman husband had been seriously ill but finally the doctor announces that he would live. What do you mean? You told me that he couldn't last another two weeks, complained the wife. "Well, I'm going to cure him after all. Surely you're glad aren't you" replied the doctor. It puts me in kind of a trouble said the woman I've gone and sold his clothes to pay for the funeral. (71 Shr)
30. Robotization are by and large a viable propositions. The machines can worked round the clock, raise output, protected quality and industrial competitive. (70 Ma)
31. Hamlet had just enough life left in him to hear Horatio's promise: then whispering the words the rest in silence he sank down dead such was the end of the brave and noble prince of Denmark. He was mourned as one who would have made a splendid king, and he was carried to his burial with soldiers music and a people's mourning. (70 Bh)

2 Interpretation

(5 Marks)

1. Addressing the youth workforce and returnee migrants and bolstering employment opportunities in the country are crucial for Nepal's sustainable development. As a corollary to this, due consideration is needed to raise the capability of the labor force. The youths can be better positioned to enrich the health of the economy by exploiting the available economic potentiality and catering to the demand of the labor market. To attain this, governmental agencies must motivate the academic institutions and the business sector to put collaborative effort to educate and train youths and remediate the educational skill gaps in the workforce. Most fresh entrants to the labor market are without the matching skills necessary for the job market. Hence, equipping them with Technical Education and Vocational Training (TEVT), On-the-Job Training (OJT), and apprenticeship/internship training is vital to make them capable and employable. The government must implement a policy to motivate the business sector to invest in training programmes to upskill and reskill migrants as well as unskilled workers. This will enable them to acclimatize to the needs of the local labor market. (82 Ba)
2. Happiness is the ultimate goal because it is self-evidently good. If we are asked why happiness matters, we can give no further external reason. Those who think about happiness are oblivious to the vast philosophical literature in which the meaning and value of happiness have been explored and questioned. They write as if nothing of any importance had been thought on the subject until it came to their attention. It was the philosopher Jeremy Bentham who was more than anyone else responsible for thinking about happiness. For Bentham it was obvious that the human good consists of pleasure and the absence of pain. The Greek philosopher Aristotle may have identified happiness with self-realization in the 4th century BC, and thinkers throughout the ages may have struggled to reconcile the pursuit of happiness with other human values, but for Bentham all this was mere metaphysics or fiction. (81 Ch)
3. In the quiet corner of the café, Sarah flipped through the pages of a well-worn novel, the tactile sensation of paper beneath her fingers grounding her thoughts. Nearby, a man squinted at his tablet, adjusting the brightness and shifting uncomfortably in his seat. Sarah's focus remained steady as she lost herself in the story, her eyes free from strain and distraction. The rich scent of ink and the slight rustle of pages turned created an immersive experience, each chapter leaving a lasting impression on her mind. Meanwhile, the man sighed, rubbing his tired eyes, as notifications continued to ping in the background. (81 Bh)
4. Broken friendship may be repaired but the break will always show. Friendship is a precious thing-too precious a treasure to be carelessly broken or thrown away. The world handles the word 'friend' lightly; its real, true deeper meaning is forgotten. Your friend is one who appreciates you-your faults as well as your virtues. He understands and sympathizes with your defeats and victories, your aims and ideals, your joys and temptations, your hopes and disappointments, as no one else does or can. It is your friend to whom you turn for counsel, for comfort, for praise; he may not be as learned as some or as wise as others.
Blessed is the man or woman into whose life has come the beauty and power of such a friendship. Prize it well. Do all in your power to keep such a friendship unbroken. Avoid the break, for when it comes it cannot be mended and the jarring note mars the harmony. (81 Ba)
5. Deep thinking can transform your life. It can profoundly change the way you think, feel and behave. Thinking deeply enriches your life and encourages deeper living. To think deeply means to think beyond beliefs, preconceived ideas and prevailing opinions. It means to shed off false convictions so that the truth can unfold. The problem is that we no longer know how to think. Our thinking is unfocused, superficial and not directed. It simply occurs randomly, but we don't give much thought

to it. At the same time, we don't use our thinking processes to think deeply. We no longer seek to think beyond our own boundaries. Most are perfectly happy within the comfortable confines of their own beliefs, attitudes and prejudices. If you're not one of them, the following is for you. It will address the magnificent power of deep thinking and how thinking deeply can change your life. It will show you what you can do to think deeply and introduces you to some deep thoughts you can get started with. **(80 Ch)**

6. There is a big difference between the natural slavery of man to nature and the unnatural slavery of man to man. Nature is kind to her slaves. If she forces you to eat and drink, she makes eating and drinking so pleasant that when we can afford it, we eat and drink too much. Thus, instead of resenting our natural wants as slavery, we take the greatest pleasure in their satisfaction. The slavery of man to man is the very opposite of this. It is hateful to the body and the spirit. Our poets do not praise it; they proclaim that no man is good enough to be another man's master. Naturally the master class, through its parliaments, schools and newspapers, makes the most desperate efforts to prevent us from realizing our slavery. **(80 Bh)**
7. There is a big difference between the natural slavery of man to nature and the unnatural slavery of man to man. Nature is kind to her slaves. If she forces you to eat and drink, she makes eating and drinking so pleasant that when we can afford it, we eat and drink too much. We must go to sleep or go mad but then sleep is so pleasant that we have great difficulty in getting up in the morning. **(71 Shr)**
8. What is a master? I would say that he is not someone who teaches something, but someone who inspires the student to do his best to discover a knowledge he already has in soul. Teaching is not hard. The toughest part for a student is to practice it every day, until one achieves the necessary precision. **(80 Ba)**
9. A society in which people relate well will be able to advance economically. This is because there will be sufficient coordination and cooperation in undertaking the affairs of the society. Therefore, with good relationships, people will be able to work together in coming up with projects and also in implementing them. Such projects will be very useful to the community since with proper coordination, they will be set up such that they help almost all members of the society. **(79 Ch)**
10. The survival of the publishing industry depends upon the existence of a public who will buy the printed word in the form of newspapers, books and magazines. Over the past several years, however, the advance of electronic media, particularly CD-ROMs, online computer services, and the internet, has made information available to the public electronically without the need for printed materials. As the availability of electronic media increases and as it is more easily accessible, the public has less need for printed materials. **(79 Bh)**
11. By teaching all other subjects, except moral values, we may produce great scientists, engineers, doctors, scholars, management experts and literatures, etc. comparable with the best anywhere in the world but if these great professionals do not have peace of mind and qualities of love and kindness, what kind of society will we have? **(78 Ch, 75 Ash-2, 72 Ma)**
12. Learning style is not the only area undergoing demystification: our understanding of intelligence is also being reconstructed. The IQ score, developed early in the 20th century, is supposed to be a measure of a person's innate intelligence, with a score of 100 defined as normal, or average. The higher the score, the brighter the person. Some of us grew up in communities where IQ was barely mentioned. In many cases this lack of knowledge might have been a blessing. Others of us grew up with "IQ envy", in communities where IQ scores were a big part of our culture. Since the score is considered a fixed, permanent measure of intellect like a person's physical height, the scores engendered strong feelings.

Friends who scored higher on an IQ test had a secret weapon, a mysteriously wonderful brain. But then our friend "genius" was stumped trying to unpack and plug in a toaster oven or got hopelessly lost trying to follow the simplest driving directions. We may have been equally puzzled when another friend, who scored horribly low on an IQ test, went on to fame and riches. What is this traditional assessment of intelligence supposed to mean? (78 Ka)

13. The history of civilization shows man always how has to choose between making the right and wrong use of discoveries of science. This has never been truer than in our age. In a brief period, amazing discoveries have been made and applied to practical purposes. It has become a platitude to say - we are living in an age of revolution. (78 Bh)

14. Patience is better than wisdom: An ounce of patience is worth a pound of brains. All men praise patience, but few can practice it. It is medicine which is good for all diseases, but it is not every garden that grows the herbs to make it with. Many people are born crying, live complaining and die disappointed. They think every other person's burden to be light and their own feathers to be heavy as lead, and yet if the truth were known, it is their fancy rather than their fate that makes things go so hard with them. Many would be well off they could but think so. (77 Ch)

15. Computers and the Internet have made a revolution in science and engineering. Studying computational models of reality can be cheaper and better than studying reality. Sometimes reality is impossible to measure or too steep to scale, and computational models are the only way to get any purchase on it. Those are the actual computer revolutions; the others are mostly potential and not real, locked up in awe-inspiring icebergs that just float around eliciting admiration and making trouble. The computer revolution is still frozen, latent, waiting to happen. (76 Ch)

16. If we observe the actions of men, whether as individuals or as groups, and whether scientists or non-scientists, we find that they frequently fall into avoidable errors because of a failure to reason correctly. There are many reasons for this, though only a few can be dealt with here. The first difficulty is bound up with (related to) the use of words. It frequently happens that what one person means when he uses a certain word is different from what others mean. Consider, for example, the words intelligence, oxygen, accurate and average. In intelligence, we face the problem that a word may not mean only one thing, but many—in this instance a very complicated set of aptitudes and abilities whose numbers and characteristics are not agreed upon by the specialists who study the phenomenon, and are even less understood by the layman (non specialist). In oxygen, we have a different problem, for although both a research chemist and a chemical manufacturer identify the word theoretically with the element O, in practice they have different concepts about it. Thus, if the researcher performed a delicate experiment, using the manufacturer's oxygen, it might easily be a failure since the so-called O, whether used as a solid, liquid, or gas, would almost certainly contain other substances. Hence, another difficulty about words is that they often do not differentiate clearly enough between several varieties of the 'same' thing. (76 Ash)

17. Broken friendship may be repaired but the break will always show. Friendship is a precious thing—too precious a treasure to be carelessly broken or thrown away. The world handles the word 'friend' lightly; its real, true, deeper meaning is forgotten. Your friend is one who appreciates you—your faults as well as your virtues. He understands and sympathises with your defeats and victories, your aims and ideals, your joys and temptations, your hopes and disappointments, as no one else does or can. It is your friend to whom you turn for counsel, for comfort, for praise; he may not be as learned as some or as wise as others. Blessed is the man or woman into whose life has come the beauty and power of such a friendship. Prize it well. Do all in your power to keep such a friendship unbroken. Avoid the break, for when it comes it cannot be mended and the jarring note mars the harmony. (76 Bh)

18. I think that wisdom can be taught. But this teaching should have a larger intellectual element than has been customary in what has been thought of as moral instruction. The disastrous result of hatred and narrow-mindedness to those who feel them can be pointed out incidentally in the course of giving knowledge. I do not think that knowledge and morals ought to be too much separated. It is true that the kind of specialized knowledge which is required for various kinds of skill has little to do with wisdom. But it should be supplemented in education by wider surveys calculated to put it in its place in the total of human activities. Even the best technicians should also be good citizens and when I say 'citizens', I mean citizen of the world and not of this or that nation. With every increase of knowledge and skill, wisdom becomes more necessary, for every such increase augments our capacity for realizing our purposes and therefore augments our capacity for evil, if our purposes are unwise. The world needs wisdom as it has never needed it before; and if knowledge continues to increase, the world will need wisdom in the future even more than it does now. (76 Ba)
19. There is a big difference between the natural slavery of man to nature and the unnatural slavery of man to man. Nature is kind to her slaves. If she forces you to eat and drink, she makes eating and drinking so pleasant that when we can afford it, we eat and drink too much. Thus, instead of resenting our natural wants as slavery, we take the greatest pleasure in their satisfaction. The slavery of man to man is the very opposite of this. It is hateful to the body and the spirit. Our poets do not praise it; they proclaim that no man is good enough to be another man's master. Naturally the master class, through its parliaments, schools and newspapers, makes the most desperate efforts to prevent us from realizing our slavery. (75 Ash)
20. The planet on which man lives is the third closest to the sun, with the third shortest orbit. It has something none of the others has- an atmosphere that can support life in all the manifold forms that exist on our planet. There may be satellites circling other stars in other parts of the universe, which have the right ingredients for some sort of life to evolve, but the earth is the one one in the solar system. (75 Ba)
21. The third great defect of our civilization is that it does not know what to do with its knowledge. Science has given us powers fit for the Gods, yet we use them like small children. For example, we do not know how to manage our machines. Machines were made to be man's servants; yet he has grown so dependent on them that they are in a fair way to become his masters. Already most men spend most of their lives looking after and waiting upon machines. And the machines are very stern masters. They must be fed with coal, and given petrol to drink, and oil to wash with, and they must be kept at the right temperature. And if they do not get their meals when they expect them, they grow sulky and refuse to work, or burst with rage, and blow up, and spread ruin and destruction all round them. So, we have to wait upon them very attentively and do all that we can to keep them in good temper. Already we find it difficult either to work or play without the machines, and a time may come when they will rule us altogether, just as we rule the animals. (74 Ch)
22. Computers have solved many problems for us, but they create some problems too. Say, for example, that you are writing a novel. After you are done with your first draft you decide to change your heroine's name from Linda to Lydia. With a typewriter you would have to retype every page containing the heroine's name. With word processing software, on a computer, you press just a few keys and the computer takes care of all the work. But technology hasn't solved all our problems. While many of Shakespeare's original documents survive, it takes only misplaced keystrokes to wipe out your next masterpiece. (74 Ash)
23. We are all short-sighted and very often see but one side of a matter; our views are not extended to all that has a connection with it. From this defect, I think no man is free. We see but in part, and we know but in part, and therefore, it is no wonder we conclude not right from our partial views. This might instruct the proudest esteemer of his own parts how useful it is to talk and consult with

others, even such as come short of him in capacity, quickness and penetration; for since no one sees all, and we generally have different prospects of the same thing, according to our different, as I may say, positions to it, it is not incongruous to think, nor beneath any man to try, whether another man have notions of things which have escaped him, and which his reason would make use of if they came into his mind. (74 Bh)

24. A mother creates, she protects and to speak to her of destruction means to speak against her: but he did not know this, he did nor know that he was negating her reason for existence. A mother is always opposed to death; the hand that brings death into the house of men, is hateful and abhorrent to mothers. But the son did not perceive this, for he was blinded by the cold glitter of glory that deadend the heart. (73 Ma)
25. This technical term has a wider meaning than the “culture” of history and literature. A humble cooking pot is as much a cultural product as is Beethoven sonata. In ordinary speech a man of culture is a man who can speak languages other than his own, who is familiar with history, literature, philosophy or the fine arts. In some cliques, that definition is still narrower. The cultured person is one who can talk about James Joyce, Scarlatti, and Picasso. To the anthropologist, however, to be human is to be cultured. There is culture in general and then there are the specific cultures such as Russian, American, British, Hottento, Inca. The general abstract notion serves to remind us that we cannot explain acts solely in terms of the biological properties of the people concerned, their individual past experience and the immediate situation. The past experience of other men in the ofrm of culture enters into almost every event. Each specific culture constitutes a kind of blueprint for all of life’s activities. (73 Bh)
26. Ever since humans have inhabited the earth, they have made use of various forms of communication. Generally, this expression of thoughts and feelings has been in the form of oral speech. When there is a language barrier, communication is accomplished through sign language in which motions stand for letters, words and ideas. Tourists, the deaf and the mute have had to resort to this form of expression. many of these symbols of whole worlds are very picturesque and exact can be used internationally; spelling, however, cannot. (73 Shr)
27. It is not only in public ways, but in private life equally; that wisdom is needed. It is needed in the choice of ends to be pursued and in emancipation from personal prejudice. Even an end which it would be noble to pursue if it were attainable may be pursued unwisely if it is inherently impossible of achievement. Many men in past ages devoted their lives to a search for the philosopher’s stone and the elixir of life. No doubt, if they could have found them, they would have conferred great benefits upon mankind, but as it was, their lives were wasted. I think the essence of wisdom is emancipation, as far as possible, from the tyranny of the here and the now. We cannot help the egoism of our senses. Sight and sound and touch are bound up with our own bodies and cannot be made impersonal. Our emotions start similarly from ourselves. An infant feels hunger or discomfort, and is unaffected except by his own physical condition. Gradually with the years his horizon widens and in proportion as his thoughts and feelings become less personal and less concerned with his own physical states, he achieves growing wisdom. This is of course a matter of degree. No one can view the world with complete impartiality; and if anyone could, he would hardly be able to remain alive. But, it is possible to make a continual approach towards impartiality, on the one hand, by knowing things somewhat remote in time or space and, on the other hand, by giving to such things their due weight in our feelings. It is this approach towards impartiality that constitutes growth in wisdom. Can wisdom in this sense be taught? And, if it can, should the teaching of it be one of the aims of education? I should answer both these questions in the affirmative. (72 Ch)
28. For half of the day we are slave to necessities which we cannot shirk, whether we are monarchs with a thousand servants or humble laborers with no savants but their wives. And the wives must undertake

the additional heavy slavery of child-bearing if the world is still to be peopled. These natural jobs cannot be shirked. But they involve other jobs which can. As we must eat we must provide food; as we must sleep we must have beds and bedding in houses with fireplaces and coals; now, food and houses and clothes can be produced by human labour. If you are too lazy to get about from place to place on your own legs, you can make a slave of a horse. And what you do to a horse, you can also do to a man or a woman or a child if you can get the upper hand of them by force or fraud or trickery of any sort. (72 Ash)

29. The prevention of free inquiry is unavoidable so long as the purpose of education is to produce belief rather than thought to compel the young to hold positive opinions on doubtful matters rather than to let them see the doubtfulness and be encouraged to independence of mind. Education ought to foster the wish for truth, not the conviction that some particular creed is the truth. (71 Ch)
30. Most men and women, given suitable conditions, will feel passionate love at some period of their lives. For the inexperienced, however, it is very difficult to distinguish passionate love from mere sex hunger; especially is this the case with well-brought-up girls, who have been taught that they could not possibly like to kiss a man unless they loved him. If a girl is expected to be a virgin when she marries, it will very often happen that she is trapped by a transient and trivial sex attraction, which a woman with sexual experience could easily distinguish from love. This has undoubtedly been a frequent cause of unhappy marriages. Even where mutual love exists, it may be poisoned by the belief of one or both that it is sinful. This belief may, of course, be well founded. Parnell, for example, undoubtedly sinned in committing adultery, since he thereby postponed the fulfilment of the hopes of Ireland for many years. (71 Ma)
31. Today, jet-lag is a familiar hazard for the seasoned traveler. Travel across time zones plays havoc with the biological clock rhythms of the human body. For the active pilot, who is rarely in one place long enough to know if it is time for breakfast or dinner, the impact of jet-lag on his sleep is critical. Several air disasters have been partly caused by overtired pilots ignoring the natural laws of sleep. Much research is directed to finding out what these laws are and what extent pilot and astronauts disobey them. But they are laws which affect all of us, not just pilots. (71 Bh)
32. Worst of all were the nights; in the nocturnal stillness the groans and cries were more distinctly audible, black shadows crept stealthily from the gorges of the distant mountains towards the half-demolished walls, hiding enemy camp from view and over the black ridges of the mountains rose the moon like a lost shield dented by sword blows. (70 Ma)
33. What is a democratic government to do in a country where people are steeped in ignorance and superstition, where there is opposition or resistance to even mild reforms from vested interests in society? (70 Bh)

3 Note Making & Summary

(5+5 Marks)

1. (82 Ba)

Brain drain, the emigration of highly skilled individuals, is a growing concern in Nepal. A significant number of professionals, including doctors, engineers, and academics, leave the country seeking better career prospects, higher salaries, and improved living conditions abroad. This exodus hampers Nepal's development by depriving it of the talent needed for progress and innovation. The causes of brain drain in Nepal are multifaceted. The primary reasons include inadequate employment opportunities, uncompetitive salaries, political instability, and corruption. Many professionals struggle to find jobs that match their qualifications and feel frustrated by the lack of meritocracy. Additionally, poor infrastructure and limited access to advanced technology and resources drive many to seek better opportunities elsewhere. The allure of superior education systems and overall quality of life in developed countries also plays a significant role.

To address brain drain, Nepal must create more job opportunities and offer competitive salaries. Investing in high-skilled industries and fostering an environment that recognizes and rewards talent is crucial. Enhancing education and research facilities can encourage individuals to stay. Combating corruption and promoting transparency will help restore trust in the system. Establishing strong networks with Nepalese professionals abroad can facilitate the transfer of knowledge back to Nepal. Implementing policies that provide incentives for returning professionals, such as tax breaks or grants for starting businesses, can also encourage expatriates to contribute to the country's development.

Environmental pollution, a pervasive yet often overlooked consequence of modern progress, is a complex issue rooted in human activities that disrupt the natural equilibrium. The industrial revolution, urban expansion, and technological innovations have propelled humanity forward but at the cost of contaminating air, water, and soil with harmful substances. Factories and vehicles release noxious gases, agricultural practices rely heavily on chemical fertilizers and pesticides, and the convenience of plastic has burdened ecosystems with non-biodegradable waste. These pollutants slowly but surely degrade the environment, manifesting in more visible outcomes such as deteriorating ecosystems and scarcer natural resources, while also causing insidious harm to human health and societal well-being.

To counter this silent crisis, it is imperative to rethink priorities and take collective action. Transitioning from fossil fuels to renewable energy sources like solar, wind and hydropower can significantly reduce emissions. Better waste management practices, such as recycling, composting, and reducing plastic dependency, can alleviate the pressure on landfills and waterways. Governments must enforce stricter environmental regulations, while industries should adopt sustainable practices, such as green technologies and cleaner production methods. Public awareness campaigns play a crucial role in fostering eco-friendly habits, encouraging individuals to embrace small changes, like using public transport, conserving water, or planting trees that collectively make a significant difference. By embedding sustainability into lifestyles and decision-making processes, society can mitigate the long-term effects of pollution, ensuring a cleaner, healthier, and more resilient environment for generations to come.

3. 81 Bh

Women's participation in economy is one of the cornerstones of sustainable development. So, it is imperative to invest for their empowerment right from when they are children. Evidence shows that an extra year of girls' education cuts infant mortality by 5 to 10 percent. According to the

UNICEF, educating girls for six years or more drastically and consistently improves their prenatal care, postnatal care, and childbirth survival rates. Educating mothers also greatly cuts the death rate of children under five. Educated girls have higher self-esteem, are more likely to avoid HIV infection, violence, and exploitation, and to spread good health and sanitation practices to their families and throughout their communities. And an educated mother is more likely to send her children to school. An educated girl is highly likely to join the workforce and meaningfully increase the economic output. Women's economic participation promotes productivity, enterprise development at the micro, small, and medium enterprise levels. It also enhances business management and returns on investment. There is a growing universal recognition that no economy can reach its full potential where women do not have equal opportunities. This explains why even the most conservative societies, where women had historically been assigned traditional roles confined within a house, are increasingly allowing their women members to venture out, work alongside men, and contribute to the economy. Investment in women produces far-reaching results. Because they reinvest a large portion of their income in their families and communities, women play leading roles in creating peaceful and stable societies – necessary prerequisites for economic growth. To make this happen, such investment in woman must begin very early in her life. A World Bank research shows that brain development is the most rapid in the initial years of life, and every additional dollar invested in early childhood development programs yields a return of between \$6 and \$17.

4. 81 Ba

To biomedical researchers all over the world, twins offer a precious opportunity to untangle the influence of genes and the environment- of nature and nurture. Because identical twins come from a single fertilized egg that splits into two, they share virtually the same genetic code. Any difference between them-one twin having younger-looking skin, for example-must be due to environmental factors such as less time spent in the sun.

Alternatively, by comparing the experiences of identical twins with those of fraternal twins, who come from separate eggs and share on average half their DNA, researchers can quantify the extent to which our genes affect our lives. If identical twins are more similar to each other with respect to an ailment than fraternal twins are, then vulnerability to the disease must be rooted at least in part in heredity.

These two lines of research-studying the difference between identical twins to pinpoint the influence of environment, and comparing identical twins with fraternal ones to measure the role of inheritance-have been crucial to understanding the interplay of nature and nurture in determining our personalities, behavior, and vulnerability of disease.

5. 80 Ch

Picture this scene. It's an English literature lesson in a UK school, and the teacher has just read an extract from Shakespeare's *Romeo and Juliet* with a class of 15-year-olds. He's given some of the students' copies of *No Fear Shakespeare*, a kid-friendly translation of the original. For three students, even these literacy demands are beyond them. Another girl simply can't focus and he gives her pens and paper to draw with. The teacher can ask the *No Fear* group to identify the key characters and maybe provide a tentative plot summary. He can ask most of the class about character development, and five of them might be able to support their statements with textual evidence. Now two curious students are wondering whether Shakespeare advocates living a life of moderation or one of passionate engagement.

As a teacher myself, I'd think my lesson would be going rather well if the discussion went as described above. But wouldn't this kind of class work better if there weren't such a huge gap between the top and the bottom? If we put all the kids who needed literacy support into one class, and all the students

who want to discuss the virtue of moderation into another?

The practice of 'streaming', or "tracking", involves separating students into classes depending on their diagnosed levels of attainment. At a macro level, it requires the establishment of academically selective schools for the brightest students and comprehensive schools for the rest. Within schools, it means selecting students into a 'stream' of general ability, or "sets of subject-specific ability. The practice is intuitively appealing to almost every stakeholder.

6. **80 Bh**

Dowsing the millennia-old practice of finding hidden things. The most well-known activity of dowsing involves the use of a device such as a forked stick to locate underground water. To this end, the dowser walks slowly back and forth over an area of ground holding the dowsing tool out in front with both hands. It is said that the dowser, by concentrating carefully is somehow able to feel the energy of the flowing underground streams-vibrating through the rod at certain frequencies, and thus is able to tell precisely where to dig or drill to find water. Sometimes the dowsing tool will twist and jerk or suddenly point downward. Some dowsers hold two L-shaped rods, one in each hand. In this case, when he or she walks over an area of underlying water, the rods cross over indicating the place where digging should commence. In recent years dowsing has gained in popularity not only as a method for finding underground water but also for trying to uncover other objects including buried treasure, oil or even dead bodies. A recent application has been the search for what some consider harmful energy fields in an attempt to avoid them. Even large businesses and official organizations pay dowsers for their detection skills. Although no one is completely sure how dowsing works, the testimonials of satisfied customers bear witness to the success of this ancient art.

7. **80 Ba**

Education is an integral part of people's lives; it will either make them or break them in the prospect depending on their careers. Education is broadly diverse today compared to the 1950s because of progressions in teaching methods and other prominent inventions that implement more apparent teaching techniques. Online learning is one of the imminent trends in the education sector around the globe at present. This mode of learning is done through the internet. With advanced and upgraded technologies; this mode of learning has been made simpler. Online Education is also preferred in higher learning Institutions.

In E-learning, the students study from home or any other place, that is most convenient for them. They can acquire learning material online. The study materials in online education could be texts, audio, notes, videos and images. Online learning has its various benefits. It is suitable for those who cannot visit or obtain the traditional education method for one reason or the other. Nearly 6.1 million college students are currently attending online courses, and this number is growing by around 30 percent yearly. Online education provides a myriad of advantages for people, as well as companies because it allows for, among others, flexibility. Online education's potential advantages involve increased educational access; it provides a high-quality learning opportunity, improves student outcomes and skills, and expands educational choice options.

8. **79 Ch**

In the technological systems of tomorrow-fast, fluid and self-regulating-machines will deal with the flow of physical materials; men with the flow of information and insight. Machines will increasingly perform tasks. Machines and men both, instead of being concentrated in gigantic factories and factory cities, will be scattered across the globe, linked together by amazingly sensitive, near-instantaneous communications. Human work will move out the factory and mass office into the community and the home. Machines will be synchronized, as some already are to the billionth of a second; men will be

de-synchronized. The factory whistle will vanish. Even the clock, "the key machine of the modern industrial age," as Lewis Mumford called it a generation ago, will lose some of its power over humans' as distinct from technological affairs. Simultaneously, the organization needed to control technology will shift from bureaucracy to quocracy, from permanence to transience and from a concern with the present to a focus on the future.

In such a world, the most valued attributes of the industrial age become handicaps. The technology of tomorrow requires not millions of lightly lettered men, ready to work in unison at endlessly repetitive jobs, it requires not men take orders in unblinking fashion, aware that the price of bread is mechanical submission to authority, but men who can make critical judgments, who can weave their way through novel environments, who are quick to spot new relationships in the rapidly changing reality. It requires men who, in C.R. Snow's compelling terms, "have the future in their bones."

9. **79 Bh**

The world needs to dramatically reduce its greenhouse gas emissions and fast, if there's any hope of preventing worse and more frequent extreme weather events. That means shifting to renewable sources of energy – and, importantly, decarbonizing transportation, a sector that is now responsible for about a quarter of the world's carbon dioxide emissions. But the path to that cleaner future is daunting, clogged with political and societal roadblocks, as well as scientific obstacles. Perhaps that's one reason why the electric vehicle – already on the road, already navigating many of these roadblocks – swerved so dramatically into the climate solutions spotlight in 2021.

Just a few years ago, many automakers thought electric vehicles, or EVs, might be a passing fad, says Gil Tal, director of the Plug-in Hybrid and Electric Vehicle Research Center at the University of California, Davis. It's now clear to everyone that [EVs are] here to stay. Globally, EV sales surged in the first half of 2021, increasing by 160 percent compared with previous year. Even in 2020 - when most car sales were down due to the COVID-19 pandemic – EV sales were up 46 percent relative to 2019. Meanwhile, automakers from General Motors to Volkswagen to Nissan have outlined plans to launch new EV models over the next decade: GM pledged to go all - electric by 2035, Honda by 2040. Ford introduced electric versions of its iconic Mustang and F - 150 pickup truck.

"Consumer demand for EVs isn't actually driving the surge in sales", Tal says. The real engine is a change in supply due to government policies automakers to boost their EV production. The European Union's toughened CO₂ emissions laws for the auto industry went into effect in 2021, and automakers have already bumped up new EV production in the region. China mandated in 2020 that EVs make up 40 percent of new car sales by 2030. Costa Rica has set official phase-out targets for internal combustion engines.

10. **78 Ch**

All people who speak the same language have agreed to use certain words for certain jobs and this enables them to communicate with each other. There is nothing particularly remarkable about the words themselves: they might just as well have chosen different ones. What matters is that this agreement about the use of words should be fully understood, and understood in detail, by everyone who wishes to profit by them. Let us take example of bell-ringing. By itself, the ringing of a bell means nothing. But in certain recognized context, it may, mean different things as different as 'time for school!' 'somebody at the door!' 'that is the end of the lesson' or 'come here, please waitress!' We might well wonder how it is that the same noise can mean so many different things, but of course the answer is easy. The noise occurs in recognized contexts: in times and places when we know that it can only mean one thing. Thus, almost anything can be used to communicate several different things. Let us apply to this verbal signs or words. First we can communicate just as well by using 'father',

‘pater’, ‘Daddy’ or anything else provided we are understood, it makes no difference. We can invent a completely new word too. Secondly, the same collection of letters can be used to communicate quite different things. The word ‘port’ can mean a special sort of wine, the opposite of starboard, a harbor, the various other things. The significance of any sign, therefore, depends on the context in which it is used.

11. 78 Ka

Coronavirus disease (COVID-19) is an infectious disease caused by a newly discovered coronavirus. Most people infected with the COVID-19 virus will experience mild to moderate respiratory illness and recover without requiring special treatment. Older people, and those with underlying medical problems like cardiovascular disease, diabetes, chronic respiratory disease and cancer are more likely to develop serious illness.

The best way to prevent and slow down transmission is to be well informed about the COVID-19 virus, the disease it causes and how it spreads. Protect yourself and others from infection by washing your hands or using an alcohol based rub frequently and not touching your face. The COVID-19 virus spreads primarily through droplets of saliva or discharge from the nose when an infected person coughs or sneezes, so it is important that you also practice respiratory etiquette (for example, by coughing into a flexed elbow).

If COVID-19 is spreading in your community, stay safe by taking some simple precautions, such as physical distancing, wearing a mask, keeping rooms well ventilated, avoiding crowds, cleaning your hands and coughing into a bent elbow or tissue.

12. 78 Bh

Acupuncture is a system of treatment of disease which has been practiced in China for nearly 5000 years. It consists in the rapid insertion of fine steel needles, about six centimeters long, on particular spots on the body of the patient. After inserting the needle, the doctor twirls the needle between his thumb and forefinger. There are hundreds of acupuncture points on the body. When acupuncture is made on a spot on the body, energy flows from there along line known as meridians to the diseased organ. The flow of energy helps to restore the balance of the system and thus correct the disorder. The points of treatment may be far from the seat of the disease. For example, to cure a toothache, the acupuncturist may insert a needle on the palm of the patient.

Although China is considered to be the country where acupuncture originated, some forms of treatment resembling it has been reported from other parts of the world by anthropologists. Among some ancient tribes, stones and arrows were used to prick the skin. In another form of treatment, the skin on particular spot of the body was burnt to affect a cure for certain diseases. Whether these kinds of treatment can rightly be classed with acupuncture can be known only after further research.

For long acupuncture was dismissed by the west as a form of superstition like witchcraft and magic cure. Even in China admiration for the western system of medicine was so great that the native systems of treatment were neglected or mistrusted. Moreover, the theoretical basis of acupuncture that was propounded in China was a mixture of spirituality, philosophy and physiology. This stood in the way of its acceptance by Chinese scientists.

During the 1960s acupuncture came to the notice of western scientists, who viewed it with skepticism as well as curiosity. Doctors from Europe went to China to make a firsthand study of this strange form of treatment. They were convinced by what they saw that acupuncture worked. Not only were

diseases cured, but even operations were performed after administering anesthesia by acupuncture. The patient of such an operation could see and know what was being done, but felt no pain. After the operation, he could get up and walk away. Doctors in other parts of the world took acupuncture seriously and some of them trained themselves and set up practices in their countries. In China itself the status acupuncture rose when Chinaman Mao officially ranked acupuncturist with other physicians.

13. **77 Ch**

Recent advances in science and technology have made it possible for geneticists to find out abnormalities in the unborn foetus and take remedial action to rectify some defects which would otherwise prove to be fatal to the child. Though genetic engineering is still at its infancy, scientists can now predict with greater accuracy a genetic disorder. It is not yet an exact science since they are not in a position to predict when exactly a genetic disorder will set in. While they have not yet been able to change the genetic order of the gene in germs, they are optimistic and are holding out that in the near future they might be successful in achieving this feat. They have, however, acquired the ability in manipulating tissue cells. However, genetic mis-information can sometimes be damaging for it may adversely affect people psychologically. Genetic information may lead to a tendency to brand some people as inferiors. Genetic information can therefore be abused and its application in deciding the sex of the foetus and its subsequent abortion is now hotly debated on ethical lines. But on this issue geneticists cannot be squarely blamed through this charge has often been levelled at them. It is mainly a societal problem. At present genetic engineering is a costly process of detecting disorders but scientists hope to reduce the costs when technology become more advanced. This is why much progress in this area has been possible in scientifically advanced and rich countries like the USA, UK and Japan. It remains to be seen if in the future this science will lead to the development of a race of superman or will be able to obliterate disease from this world.

14. **76 Ch**

The critical period theory is consistent with a vast amount of data that has been accumulating for many years about patients suffering from aphasia, a loss of language abilities associated with brain damage from injury or disease. The data provide conclusive evidence that language is localized in the brain's left hemisphere. Seventy percent of adult patients with an injury to the left hemisphere suffer from some language disability. However, patients with injuries to the right hemisphere retain the ability to speak and understand language perfectly. Their problems lie elsewhere, in activities such as recognizing faces and patterns or finding their way from one place to another.

/ Evidence for the effects of cerebral lateralization on language learning also comes mainly from research with patients suffering from aphasia after a hemispherectomy, surgery to remove one hemisphere of the brain. Lenneberg (1967), in his own research and in the relevant medical literature, found that 97 percent of children undergoing this operation before the age of ten recovered their language abilities after some temporary aphasia and continued to acquire their first language. In those rare cases where the same type of surgery was performed on adults, however, all the patients were left with complete and permanent aphasia. From this research, it seems that a child's brain has a degree of flexibility that allows the right hemisphere, when necessary, to take over the functions of the left. After lateralization, this flexibility declines significantly, and adults who lose language through brain injuries are unable to regain it. On the basis of these research findings, proponents of the critical period theory claim that it is this lack of flexibility in adults that limits their ability to acquire native-speaker pronunciation in a second language.

15. **76 Ash**

Plagiarism is the use of other person's ideas and expressions in your writing without acknowledge the source. The word comes from the Latin word 'plagiaris' and Alexander Lindey defines it as "the false assumption of authorship: the wrongful act of tacking the product of another person's mind

and presenting it as one's own". In short, to plagiarize is to give impression that you have written or thought something that you have in fact borrowed from someone else, and to do so is considered a violation of the personal responsibility to acknowledge "academic debts".

The most blatant form of plagiarism is reproducing someone else's sentences, more or less verbatim, and presenting them as your own. Other forms include repeating another's particularly apt phrase without appropriate acknowledgement, paraphrasing someone else's argument as your own, introducing another's line of thinking as your own development of an idea, and failing to cite the source for a borrowed thesis or approach. Plagiarism falls outside the scope of copyright infringement. Copyright infringement, in contrast, is using the work of a copyrighted work beyond the limit of fair use without the permission of the owner of copyright law are not plagiarism. The penalties of plagiarism can be severe, ranging from loss of respect to loss of degrees, tenure or even employment. At all stages research and writing, you must guard against the possibilities of inadvertent plagiarism by keeping careful notes that distinguish between your own musings and thoughts and material you gather from others.

Even without considering the penalties of plagiarism, the best scholars generously acknowledge their debts to others. By doing so they not only contribute to the historiography of scholarship but also help younger scholars understand the process of research and discovery.

16. **76 Bh**

Dowsing the millennia-old practice of finding hidden things. The most well-known activity of dowsing involves the use of a device such as a forked stick to locate underground water. 17. **76 Ba**

There is an enemy beneath our feet—an enemy more deadly for his complete impartiality. He recognizes no national boundaries, no political parties. Everyone in the world is threatened by him. The enemy is the earth itself. When an earthquake strikes, the world trembles. The power of a quake is greater than anything man himself can produce. But today scientists are directing a great deal of their effort in finding some ways of combating earthquakes, and it is possible that at some time in the near future mankind will have discovered a means of protecting itself.

An earthquake strikes without warning. When it does, its power is immense. If it strikes a modern city, the damage it causes is great as it has struck primitive village. Gas mines burst; explosions are caused and fires are started. Underground railways are wrecked.

Whole building collapse; bridges fall; dams burst. Gaping crevices appear in busy streets. If the quake strikes at sea, huge tidal waves sweep in on the land. If it strikes mountain regions, avalanches roar down into the valley. Consider the terrifying statistics from the past 1755: Lisbon, capital of Portugal — the city was destroyed and 450 killed. In 1970, in Peru 50,000 killed.

In 1968, an earthquake struck Alaska. As this is a relatively unpopulated part, only a few people were killed. But it is likely that this was one of the most powerful quakes ever to have hit the world. Geologists estimate that during the tremors, the whole world of the state moved over 80 feet further west into the Pacific Ocean. Imagine the power of something that can move an entire sub-continent! This is the problem that faces the scientists. They are dealing with forces so immense that man cannot hope to resist them. All that can be done is to try to pinpoint just where the earthquake will strike and work from there. At least some precautionary measures can be taken to save lives and some of the property.

18. 75 Ash, 74 Ash

The dearth of natural resources on the Australian continent is a problem with which government officials there have long struggled. As long distance travel has become ever more important to the national economy. Tourism represents more than 10 percent of national export earnings annually, and in less developed regions such as the Western Territory, the percentage is much higher.

Unfortunately, this otherwise rosy prospect has one significant cloud on the horizon. In recent years, there has been a move towards returning some of the land to the Aboriginal people. As Western society and culture have flourished on Australian soil, tribal people have been forced ever farther inland in an attempt to maintain their traditional ways of living, a desire that the government has striven to respect.

One of the central beliefs of the Aboriginal religion is that certain natural formations have spiritual significance and must be treated accordingly. Strict guidelines determine who may visit these sites and at what times. Unfortunately, many of these sites are the very natural wonders tourists flock to see. If non-Aboriginal people are forbidden to visit these natural wonders, many may choose not to vacation in a region that surely needs the income generated by tourism.

The Australian government has dealt with this dilemma thus far by trying to support both sides. The Aboriginal council is still trying to put an end to such use of certain sites, however, and it remains to be seen whether respect for tradition or economic desires will ultimately triumph.

19. 75 Ash

Is classical music any way related to popular music? That is a controversial question. Advocates of classical music claim that it constitutes art and that pop music is only light entertainment. But, that is not always true. Some people have only elevated classical music to that special status by arguing that the works are more complex because of the range of notes involved. However, jazz, rap and many other forms of popular music sometimes do make use of a number of notes that are as complex as classical music. It is also argued that classical music songs are longer, sometimes extending to thirty minutes or more. Popular music songs are shorter and more repetitive so that they can be remembered for people to play or to sing.

Every language has its own popular music, like it has its own classical music. Indian popular music often known as Indi-pop or Hindi pop is a form of pop music in India. It is a fusion of various Indian folk and classical music styles and is also influenced by modern beats from different parts of the world.

The major push given to Indi-pop was from Pakistani singer, Nazia Hassan. Indian pop has taken another interesting turn with the "remixing" of old Indian film songs-an attempt to make them sound more modern by adding new beats. These remixes have become very popular among the younger generation; they give the old melodies new life and vigour. The purists among the older generation however maintain that the beauty of the song is lost!

20. 75 Ba

Men have never succeeded in keeping free from war in the past. Nor are they likely to do so in the future, as long as they are organized in separate nation states, each of which is in control of its own army, navy and air force and each of which is, therefore, to control the government believes, however, wrongly that he can obtain an advantage for himself and his country. Only some form of world government, which controls all the world's armed forces and against which no single nation or group of nations could wage war since they would not have the wherewithal to do so, can finally save the world from war.

Secondly, science, by accelerating man's speed of movement, has made the world a single whole. Hence any war which breaks out anywhere will destroy the whole of civilization and not merely the part affected by the war, as has been the case in the past. That is why the new powers conferred upon man by science increasingly demand a world government if they are not to result in man's destruction.

21. 74 Ch

Although religion does not inhibit the acquisition of wealth, although it does not hold up large fortunes as evil, the tenor of its teaching, by and large, is to induce an attitude of indifference to worldly things, things which gratify one's lower self and keep one engrossed in money-making. The students should be made to realize that the real goods of life are spiritual, love of things of the spirit and service of one's fellowmen, joy of an ordered disciplined life. These are blessings money cannot buy. What is wealth before such things of the spirit? Of all religious teachers Jesus Christ has dealt more comprehensively than any other with the problem of wealth in all its aspects. He may be called the greatest exponent of the science of wealth. With only four words "Blessed are ye poor!" he changed altogether the values which man attached to human existence and human happiness and acquisition and possession of wealth. Real bliss consisted, he taught, not in riches nor in anything else which the world regarded as prosperity or felicity, but in the joy and happiness derived from being at peace with one's fellowmen through perfect love and fellowship and selfless service and sacrifice.

The word "poor" on the lips of the Master had a spiritual significance - the poor so far as they were poor in spirit, humble before God, simple, God-fearing, teachable, faithful. It could surely not have been his intention to hold up destitution and privation as a blessing in itself. That would have turned life into a terrible ordeal and it would have been heartless to exhort the poor to believe that money was not necessary for one's sustenance or the joys and blessings of life. Even things of the spirit cannot be had without money.

Extreme poverty is as liable to lead to the stagnation and impoverishment of the soul as excessive wealth. Not outward poverty but inward spirit was what Jesus Christ desired and demanded. Every religion asks a man to regard his wealth as a trust. Giving in charity for the relief of the poor and public welfare is not merely an act of compassion, not merely a religious duty, but also an act of social justice. All the gospels of wealth are based on the fundamental concept that none can claim an absolute or inherent right to property. Everyone holds it in trust from God to promote the good mankind. All rights to private property are subject to this primary obligation to God and man.

22. 74 Bh

There are hundreds of superstitions which survive in various parts of the country and the story of

them is rather amusing. We are told, for example, that is unlucky to point to the new moon or to look at it through glass, but if we bow nine times to it we shall have a lucky month.

Now, suppose you tell a scientist that you believe a certain superstition-let us say, that the bowling of a dog is a sign of death. The scientist will immediately require evidence before he can accept your belief. He will want figures to prove it. It will be useless to quote two or three cases; he will want hundreds. He will want also to know (a) if it ever happens that the bowling of dogs is not followed by a death, (b) if ever a person's death is predicted by the bowling of dogs. The answer to the former question is in the affirmative, and to the latter in the negative. Your superstition will not bear investigation. It may impress an ignorant person; but it cannot face the light of facts. Your case would not carry conviction in a court of law.

Apart from this process of testing by results, any intelligent man will want to know the "reason why". What connection can there be between a bowling dog and an approaching death? Can it be cause and effect? Can it be that the dog has a gift of foreseeing such events? Or is the dog the instrument employed by some uncanny power that moves invisibly in our midst?

23. 73 Ma

We have all heard stories of the architect who forget to provide stairs or lifts in the block of flats he was designing. There are even sillier tales of houses designed without any doors. However, many strange buildings can still be seen. In past centuries, there were hardly any building restrictions, and rich people could build whatever they wanted. Sometimes their ideas were very odd indeed and resulted in strange 'follies', such as a triangular cottage, or a hen-house in the form of a pyramid, or house disguised as a windmill. But nowadays there are a great many restrictions, both official and aesthetic, and the architect must know all of them. The artistic and creative aspects are only a small part of the modern architect's work. He does not simply design a building and then wait for someone else to build it. He must know all the qualities of the materials he uses, and has to take into consideration heating, lighting, ventilation, insulation, drainage and any other aspects that never worried our ancestors at all.

In all building work there are three main parties; the client, the architect and builder. The client tells the architect what he wants, or, at least, gives him some idea of the kind of building he has in mind. The architect then visits the site and prepares rough plans for the client's approval. He also consults the various authorities concerned. When all the work has been approved in principle and the plans satisfy the client, the architect can then prepare working drawing and detailed instruction for the builder. Different building are then invited to submit estimates, tenders, for doing the work; the most economical tender is usually accepted. So the work begins. A modern architect is the leader of the team of specialists, and must co-ordinate all their services. There is no other profession that involves so many supplies, contractor, consultant, authorities and tradesmen. There are few jobs that are more difficult to carry out, and few that give more satisfaction when a project is completed successfully.

24. 73 Bh

The valley of Kathmandu is one of the most concentrated repositories of art and design that exist in the world; it is one of the greatest living art shows imaginable.

Nepal has long been famous for quality work. In the past beautiful bronzes were made, not only for the home market, but for export or sale to pilgrim tourists. Today, exquisite bronzes images of gods and goddesses of Hindu and Buddhist pantheons are still fashioned and sold.

The Nepalese wood-carver has always excelled in ornately carved windows and roof supports fashioned in the elegant forms of deities. It is known that the Nepalese architect, Arniko, took the pagoda style of architecture to neighbouring Tibet and from thence to China in the ninth century.

The arts of Nepal, with the exception of stone carving are still very much alive and in the cities of the valley, master craftsmen, artisans and artists are still fashioning masterpieces, following traditions and using techniques that in many cases stretch back well over a thousand years.

Large areas of the city of Patan are given over to the production of art works, and for the adventurous visitor with an interest in arts and crafts, there is always an excellent opportunity to see artists and craftsmen at work in their houses.

The advent of tourism in the late fifties acted as a stimulus to Nepalese arts and crafts as it brought with it not only a demand for small souvenirs, but also for high quality items produced by labor-intensive methods that could not be copied by machines anywhere in the world. A fine scroll painting, wood-carving or brass image made in Nepal is something unique and exclusive and buyers can feel that they have purchased one of a kind or at least one a limited edition.

To preserve the national heritage of Nepal, His Majesty's Government has banned the export of antiques of all kinds, but for those with taste and interest, there are many beautiful objects and treasures to buy in the bazaars of Kathmandu, Patan and Bhaktapur. Many new bronzes and scroll paintings have been "antiqued" and in such cases it is better to get a museum clearance from the department of Archeology, near the main gate of Singh Durbar in Kathmandu.

Over the past twenty years, the hands-woven carpet industry has grown and flourished in Nepal. The art of carpet weaving was brought from Tibet.

The mighty peaks of Himalayan ranges are what call many visitors to Nepal in the first place but nevertheless the beauty of the kingdom's art and architecture will linger in the minds of many for long after a visit to the valley of Kathmandu.

To solve the most urgent health problems of developing countries, experts have recommended that priority should be given to primary health care. This approach to health care, as we have seen, emphasizes health maintenance through disease prevention and control. Many of the developing world's deadliest diseases the experts point out; can be prevented if clean water and adequate sanitation are provided. Other diseases can be prevented by mass vaccination programs. Still others can be controlled by effective health education that gives people information about ways to avoid malaria-carrying mosquitoes or about the importance of nutrition, especially for pregnant women and young children.

Primary health care, as we have seen, does not merely focus on prevention and ignore the treatment of disease. Another priority for poorer nations is to provide timely diagnosis and basic treatment for the general populations instead of technologically advanced and expensive treatment for a few wealthy people. Under international programs, the governments of developing countries are given incentives to build community health centers and train health workers. Patients receive immediate attention from doctors, nurses and health workers who have to the necessary diagnostic training and equipment and have an adequate supply of drugs. These local health centers are much more accessible to people who

need treatment than a few hospitals in the larger cities.

If poorer countries can offer this type of health care, the health of their general populations will improve rapidly. A number of developing countries have already shown that primary health care programs can be successful. Cuba eliminated polio in 1972, even before the disease was eliminated in the United States. In 1974, World Health Organization began a program to immunize the world's children against six vaccine-preventable diseases during their first year of life. By 1994, the vaccinations were protecting 80 percent of children and the annual number of child deaths had fallen by 3 million. Another WHO program, whose goal was to wipe out polio in the Americas, began in 1985. The goal was achieved in 1991. In the year, nearly 2 million children in Peru were vaccinated in one week after polio had been diagnosed in a two-year old boy. The boy, Luis Fermin, recovered and proved to be the last case of polio in the Americas.

A recent investigation by scientists at the U.S. Geological Survey shows that strange animal behaviour might help predict earthquakes. Investigators found such occurrences within a ten-kilometre radius of the epicentre of a fairly recent quake. Some birds screeched and flew about wildly; dogs yelped and ran around uncontrollably.

Scientists believe that animals can perceive environmental changes several hours or even days before the mishap. Animals were noted as being restless for several weeks before a Tashkent, Uzbekistan, earthquake. An hour before the disaster, domestic animals refused to go indoors, and dogs howled and barked furiously. In 1960, an earthquake struck Agadir in Morocco. Survivors recall that stray animals, including dogs, were seen streaming out of town before the earthquake. In a safari zoo near San Francisco, llamas would not eat the evening before a 1979 quake, and they ran around wildly all night.

Unusual animal behaviour preceding earthquakes has been noted for centuries. British Admiral Robert Fitzroy reported huge flocks of screaming seabirds over Concepcion, Chile, in 1835. An hour and a half later, dogs were seen fleeing, and ten minutes later the town was destroyed. Similar stories of chickens running around in apparent states of panic, horses trembling, and dogs barking incessantly were recorded throughout the eighteenth and nineteenth centuries by survivors of earthquake destruction in India, Yugoslavia, Peru, Mexico, and the United States.

In 1976, after monitoring bizarre animal behaviour, the Chinese predicted a devastating earthquake. Although hundreds of thousands of people were killed, the government was able to evacuate millions of other people and thus keep the death toll at a lower level.

Is classical music in any way related to popular music? That is a controversial question. Advocates of classical music claim that it constitutes art and that pop music is only light entertainment. But, that is not always true. Some people have only elevated classical music to that special status by arguing that the works are more complex because of the range of notes involved. However, jazz, rap and many other forms of popular music sometimes do make use of a number of notes that are as complex as classical music. It is also argued that classical music songs are longer, sometime extending to thirty minutes or more. Popular music songs are shorter and more repetitive so that they can be remembered for people to play or to sing.

Every language has its own popular music, like it has its own classical music. Indian popular music, often known as Indi-pop or Hindi pop is a form of pop music in India. It is fusion of various Indian

folk and classical music styles and is also influenced by modern beats from different parts of the world. The major push given to Indi-pop was from Pakistani singer, Nazia Hassan. Indian pop has taken another interesting turn with the "remixing" of old Indian film songs-an attempt to make them sound more modern by adding new beats. These remixes have become very popular among the younger generation; they give the old melodies new life and vigour. The purists among the older generation however maintain that the beauty of the song is lost.

We can alter the characteristics of steel in various ways. In the first place, steel which contains very little carbon will be milder than steel which contains a higher percentage of carbon, up to the limit of about $1\frac{1}{2}\%$. Secondly, we can heat the steel above a certain critical temperature, and then allow it to cool at different rates. At this critical temperature, changes begin to take place in the molecular structure of the metal. In the process known as annealing, we heat the steel above the critical temperature and permit it to cool very slowly. This causes the metal to become softer than before, and much easier to machine. Annealing has a second advantage. It helps to relieve any internal stresses which exist in the metal. These stresses are liable to occur through hammering or working the metal, or through rapid cooling. Metal which we cause to cool rapidly contracts more rapidly on the outside than on the inside. This produces unequal contractions, which may give rise to distortion or cracking. Metal which cools slowly is less liable to have these internal stresses than metal which cools quickly.

On the other hand, we can make steel harder by rapid cooling. We heat it up beyond the critical temperature, and then quench it in water or some other liquid. The rapid temperature drop fixes the structural change in the steel which occurred at the critical temperature, and makes it very hard. But a bar of this hardened steel is more liable to fracture than normal steel. We therefore heat it again to a temperature below the critical temperature, and cool it slowly. This treatment is called tempering. It helps to relieve the internal stresses; and makes the steel less brittle than before. The properties of tempered steel enable us to use it in the manufacture of tools which need a fairly hard steel. High carbon steel is harder than tempered steel, but it is much more difficult to work.

These heat treatments take place during the various shaping operations. We can obtain bars and sheets of steel by rolling the metal through huge rolls in a rolling-mill. The roll pressures must be much greater for cold rolling than for hot rolling, but cold rolling enables the operators to produce rolls of great accuracy and uniformity, and with a better surface finish. Other shaping operations include drawing into wire, casting in moulds, and forging.

29. **71 Ch** One day in 2003, while on her morning walk in the park, Valavolkar felt a sharp pain in her left shoulder. The pain soon subsided and she decided to go about her chores.

But a few hours later, the waves of pain returned when she was out walking again, this time to see the neighbourhood dentist about a cavity. It was much worse than in the morning. Overwhelmed with nausea, dizziness and shoulder pain that grew more intense with every step she took, she felt too weak to move. Anyhow, her husband and son being away at work, she assumed it was spondy litis and got in touch with a family friend, an orthopedic doctor, who insisted she see a heart specialist immediately.

At workhardt hospital soon afterwards, it became clear to the medics that she was having a myocardial infarction, a heart attack caused by the blockages- in Valavolkar's case of three blood vessels to the heart. One of them, a key artery, had a 95 percent blockage. An angioplasty was performed and a stent inserted to open up the blockage. Her medical care had been so swift, however, that there was no serious damage to the heart muscle.

Since then she hadn't been without trouble, but a cardiac rehab programme she entered in 2006 has helped her lead a normal life. "I feel fine now," Valvakar says, looking back. "Periodic check ups are essential and fortunately for me, these have revealed no problems. I am very active now. I even counsel other heart patients to help them stay positive."

"Women have different risk factors for cardiac disease than men, but there is such little awareness," says Dr. Vanita Arora cardiac electrophysiologist and associate director at the Max Health Care Superspeciality Hospital in New Delhi.

30. 71 Ma

As material civilization advances and the supply of available goods and services increases, man's needs correspondingly multiply. Advertising plays a key role in this never-ending process by stimulating the public's desire for certain products, and by promoting the sales thereof, until it has, in effect, created new needs, real or supposed, where there were none before. A familiar example is the motor car-once a rare and costly novelty, now an ubiquitous and relatively inexpensive necessity. More recently, the television set has undergone the same transformation. While some people would deny that television is a necessity, the fact that sets are found in majority of western homes shows that is answer, to a greater or lesser degree, the need felt by millions of people for entertainment and information.

A product, service, or commodity that the public needs, and knows it needs, tends, of course, to 'sell itself'. We might, therefore, assume that, in such cases, advertising would be of minor importance. To some extent this is true. Meatpackers, vegetable and fruit growers, and dairy operators spend less on advertising, for instance, than manufacturers of cigarettes, liquors, cosmetics, and other items of this type.

On the other hand, the competition that exists between rival brands means that the suppliers of such basic necessities as food, clothing, and housing must advertise their wares to stay in business. Significantly, the industry that spends most on advertising turns out a product which almost everyone considers a necessity: soap.

31. 71 Bh

I was taking tea in the rooms of a fine scholar at King's College, Cambridge, the week before the Oxford and Cambridge Rugby match, when, in order to bring the conversation or the lack of it a little nearer my own intellectual level, I asked a brilliant novelist who was present: 'Are you going to match next Tuesday?' He looked as sincerely puzzled as if I had addressed him in Gaelic. 'What match?' he asked gently. I explained to him that a football match was to take place in the following week a match in which the fate of his beloved university would be involved, or at least seem to be involved, for about an hour and half. 'Honestly', he said, with a look of surprise, 'I hadn't heard about it. Had you?' he asked, turning to our host. Our host declared that the news came as a complete surprise to him also. Another scholar who was present, on being questioned on the matter, admitted that he had gathered in the course of a recent conversation that some important match was going to be played somewhere, but he did not know that it was to be against Oxford, or that it was a Rugby match, or that it was to be played at Twickenham, or that it was to take place on Tuesday.

It astonished one to find that men who were learned in every detail of the struggles between Athens and Sparta, between Rome and Carthage, could be indifferent to a struggle almost at their own doors a struggle, too, in which the prizes were not the sordid gains of political warfare, but the magnificently empty honors of sport. All present were pacifists, yet bloody battles fascinated their intellects far more than the bloodless battles of the football field - the battles, so to speak, of the future. Such indifference

to an exciting phase of contemporary life shocked me. I could have understood a stockbroker's being indifferent to the result of a great football match, but a university man, a fine mind strained in the humanities that was a very different affair. I left Cambridge a little saddened over the prospects of the human race.

32. 71 Shr

Colonising space could be much more difficult than we imagine. Scientific studies suggest that children born in space might suffer permanent nervous-system damage unless exposed to Earth-like gravity at key points in their development. One difficulty could be learning how to walk. Young children born in space could have trouble walking on Earth because their nervous systems would have developed in the low-gravity environment of space. Even adults might have difficulty fully re-adjusting to life on Earth after prolonged periods of weightlessness.

Scientists are just beginning to discover the importance of gravity in the development of life. They are already aware that it has a serious effect on cell metabolism, brain development and DNA synthesis. For this reason pregnant women cannot go into space. Studies of 18 pregnant mice launched into space carrying some 200 foetuses at varying stages of which is a normal aspect of development, slowed down in space, as did cell reproduction. Without gravity the space-grown brains were smaller and had fewer nerve cells than normal mouse brains. How this would affect the functioning of the brain in an adult animal requires further study.

Another effect could be muscle wasting. This has already been observed in astronauts, although there is disagreement as to whether it is linked to the effects of gravity on the muscle cells or just the lack of muscle use. In any case, loss of muscle strength in space has so far proven to be temporary and there are no confirmed reports of any long-term illness in people returning from long periods in space.

Other studies have produced mixed findings. One study showed that laboratory rats reared in space could not figure out how to walk properly on Earth due to spinal-cord damage suffered in space. This study also showed that newborn pups, which are born blind, need gravity in order to learn how to hold themselves upright. Other findings confirm that adult subjects, including humans, can fairly easily recover balance and navigational abilities that have been lost in space.

Clearly the importance of gravity in the development of human beings requires further study before individuals can be sent off to colonise space.

33. 70 Ma

Alloy steels as well as plain carbon steels may be classified according to their ability to harden. This is probably the most significant basis of classifying alloy and plain carbon steels. The ability to harden has been defined as the 'hardenability' of steel. The role played by the hardenability of steels is one of great importance and any test that can be made to check this characteristic of steel will prove of value in the selection and qualifications of any steel for a given applications. In fact, hardenability is an important criterion of selecting or rejecting steel for a particular purpose.

It has been determined that the hardenability of steels is dependent upon several factors and these factors do not include the chemical composition or alloy content of the steel. What are the factors that influence the hardenability of steel? Such factors as methods of manufacture, practice in shaping and variables in treating all influence the hardenability of steels. Because these variables will influence the hardenability, the usual methods of testing, without carrying out a test for hardenability, may not reveal the complete story about the steel. This being true, several methods have been designed to

measure the ability of the steel to harden. There is one principle behind all hardenability tests is to measure the maximum section or thickness of steel that can be made hard. The sominy end-quench test is recommended as a hardenability test for alloy structural and tool steels. This test can be used for both shallow- and deep-hardening.

34. **70 Bh**

All people who speak the same language have agreed to use certain words for certain jobs and this enables them to communicate with each other. There is nothing particularly remarkable about the words themselves: they might just as well have chosen different ones. What matters is that this agreement about the use of words should be fully understood, and understood in detail, by everyone who wishes to profit by them. Let us take example of bell-ringing. By itself, the ringing of a bell means nothing. But in certain recognized contexts, it may mean different things as 'time for school!', 'somebody at the door!', 'that's the end of the lesson' or 'come here, please, waitress!' We might well wonder how it is that the same noise can mean so many different things; but of course the answer is easy. The noise occurs in recognized contexts: in times and places when we know that it is not only important to communicate something, but also to do so in a way that is clear and effective.

Let us apply this to verbal signs, or words. First we can communicate just as well by using 'father', 'pater', 'Daddy', or anything else: provided we are understood, it makes no difference. We can invent a completely new word too. Secondly, the same collection of letters can be used to communicate quite different things. The word 'port' can mean a special sort of wine, the opposite of starboard, a harbour, a ship, a portage, a sign, a signal, a portent, a portmanteau, a portentous thing, a portent, a portentousness, a portentously, a portentousness, a portentous, a portentousness, a portentous, a portentousness, a porter, a portly, a portlyness, a portly, a portlyness, a portly, a portlyness, and so on. The list could go on forever.

35. **69 Bh**

Authority in the twentieth century is nowhere what it was. In certain spheres it has disappeared altogether. Public opinion no longer feels bound to enforce morality as it did by means of spoken disapproval and informal penalties. Fathers have ceased to rule the family, employers no longer enjoy the status of materials; the upper class have ceased to inspire imitation as models correct behaviour; school masters and university dons no longer dominate the minds of the young Things once considered infrequently wrong are tolerated where they are thought to do no manifest harm: fornication, adultery, homosexuality, abortion, nudity and erotica flourish openly where they were once legally penalized or forced to be discreetly veiled. Adolescents, who were once subject to the edicts of parental jurisdiction, live as they please, often earning as much as their fathers, and enjoying more legal rights at eighteen than their grandmothers possessed at any time during their lives.

But the decline of authority in the twentieth century has not necessarily meant a rise in liberty. For the concept of authority is not something which stands logically opposed to that of freedom, although some unreflective people may think it does. Authority is really a special kind of power which rests on the consent and belief of those who live under it. Without such free assent, there can be no such thing as authority. So freedom in this important sense is part of the very notions of authority. And when authority is removed, is only too likely that it will be followed either by the rule of naked power or by anarchy.

36. **68 Ch**

Since it is essential to secure rapid and complete combustion in the cylinder of an internal combustion engine, the fuel and air mixture must be thoroughly mixed; and further, it must be in the correct proportions for all running conditions of the engine. This is accomplished by means of a device called

a carburettor. In this carburettor, a stream of air blown over a jet mixes intimately with a spray of petrol drawn out of it. The jet is inserted into a choke or venturi in the intake manifold, and is supplied with petrol at atmospheric pressure.

During the suction stroke of the piston, the pressure in the intake manifold is below atmospheric, and air is induced through the intake and over the jet. As there is a further drop in pressure at the venturi, the pressure difference produced is large enough to draw petrol up out of the jet and atomise it. The level of the petrol in the jet is kept constant by the float and needle valve in the float chamber, which acts as a reservoir for the fuel. Above the venturi there is a throttle valve operated by the accelerator pedal, which controls the amount of mixture admitted to the cylinder.

However, this simple form of single-jet carburettor will not give correct mixture strength for all engine speeds. The chief difficulty encountered is that, at high running speeds, the amount of petrol taken up at the jet will increase faster than the increase in air-flow. Therefore a carburettor set to give correct mixtures at low speed will give a progressively richer mixture as the speed increases. To compensate for this, a second jet is provided, fed from a well open to the atmosphere and supplied with petrol from the float chamber. Owing to the fact that this compensating jet is larger than the main jet, it can supply petrol at a quicker rate than the main jet until the well is emptied. As the speed is increased, more and more of the petrol required is drawn from the main jet. The compensator jet can now supply only as much petrol as can pass through the small compensator orifice in the float chamber.

Another problem to be solved is that of starting. In order to obtain the rich mixture required for starting, the throttle must be almost closed. As the air velocity is then very low in the venturi, insufficient petrol is drawn out of the jet. This difficulty is overcome by the provision of an idler jet in the wall of the intake manifold near the throttle valve. This jet will only function when the throttle is nearly closed. When it is opened for faster running, the suction round the edge of the throttle decreases, and the idler automatically ceases to act.
